

Blazon Social Job Community LTD

Listening certification via user with IP via connected device

1. The certification act consists of an exchange of information encrypted with Blazon's blockchain technology of a few Kb, without leaving any trace on the electronic device, it does not involve any loss of storage memory, nor loss of efficiency of the same.
2. Acceptance of this operation is completely free, nor can Blazon S.j.c. be expected to pay from the accepting party. for the process carried out.
3. The certification carried out by the blockchain consists of verifying the transaction data with any attached documents, in order to avoid any interference (hackers) in the verification of the same.

At the time of this verification, some of the users connected to the system, listening to the radio, with consent to certify, are randomly involved (random mode) to carry out this process in a redundant way.

In this way the system becomes very secure, in fact only if all the users contacted provide the return of the encrypted data and the unique keys released correctly, the protocol will allow the transaction to pass, otherwise a "double spending" error will be reported and will have to repeat the transaction.
